

(54) IMPROVEMENT IN ELECTRIC LAMPS

Specification

Be it known that I have invented a new and useful Improvement in Electric Lamps, of which the following is a specification. The object of this invention is to produce electric lamps giving light by incandescence, which lamps shall have high resistance, so as to allow of the practical subdivision of the electric light.

The invention consists in a filament of carbon of high resistance, made as described and secured to metallic wires, the carbon being enclosed in a glass receiver substantially exhausted of air.

Claims

1. An electric lamp for giving light by incandescence, consisting of a filament of carbon of high resistance, made substantially as described, and secured to metallic wires, as set forth.
2. The combination of carbon filaments with a receiver made entirely of glass and conductors passing through the glass, and from which receiver the air is exhausted, for the purposes set forth.
